CheatSheet for a by Yutong Dai, page 1 of 1

1 The Suffciency Principle

A sufficient statistic for a parameter heta is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ

A sufficient statistic for a parameter heta is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ .

A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ

A sufficient statistic for a parameter heta is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the

sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter heta is a statistic that, in a certain sense, captures all the information about θ contained in the sample.

Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ .

A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ .

A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ .

A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ .

A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the

sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample.

Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ .

2 The Suffciency Principle A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of th sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample itional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample itional information in the sample, besides the value of th sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain ense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample ny additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . 3 The Suffciency Principle

A sufficient statistic for a parameter heta is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain ense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample.

A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain ense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the tional information in the sample, besides the value sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain ense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . 4 The Suffciency Principle A sufficient statistic for a parameter θ is a statistic that in a certain

Any additional information in the sample, besides the value of the

sufficient statistic, does not contain any more information about θ .

sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ .

Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample ditional information in the sample, besides the value of sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample tional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample itional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . 5 The Suffciency Principle A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ

A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample

A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of th sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample itional information in the sample, besides the value of sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample tional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample ditional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample litional information in the sample, besides the value of sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ .

sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of th sufficient statistic, does not contain any more information about hetaA sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of th sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of th sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample tional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of th sufficient statistic, does not contain any more information about hetaA sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about heta6 The Suffciency Principle A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about heta contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense captures all the information about θ contained in the sample Any additional information in the sample, besides the value of th sufficient statistic, does not contain any more information about hetaA sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of th sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain

A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the

sense, captures all the information about θ contained in the sample. Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample itional information in the sample, besides the value of th sufficient statistic, does not contain any more information about hetaA sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample onal information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ . A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample itional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about θ A sufficient statistic for a parameter θ is a statistic that, in a certain sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the sufficient statistic, does not contain any more information about heta

A sufficient statistic for a parameter θ is a statistic that, in a certain

sense, captures all the information about θ contained in the sample Any additional information in the sample, besides the value of the

sufficient statistic, does not contain any more information about θ .
